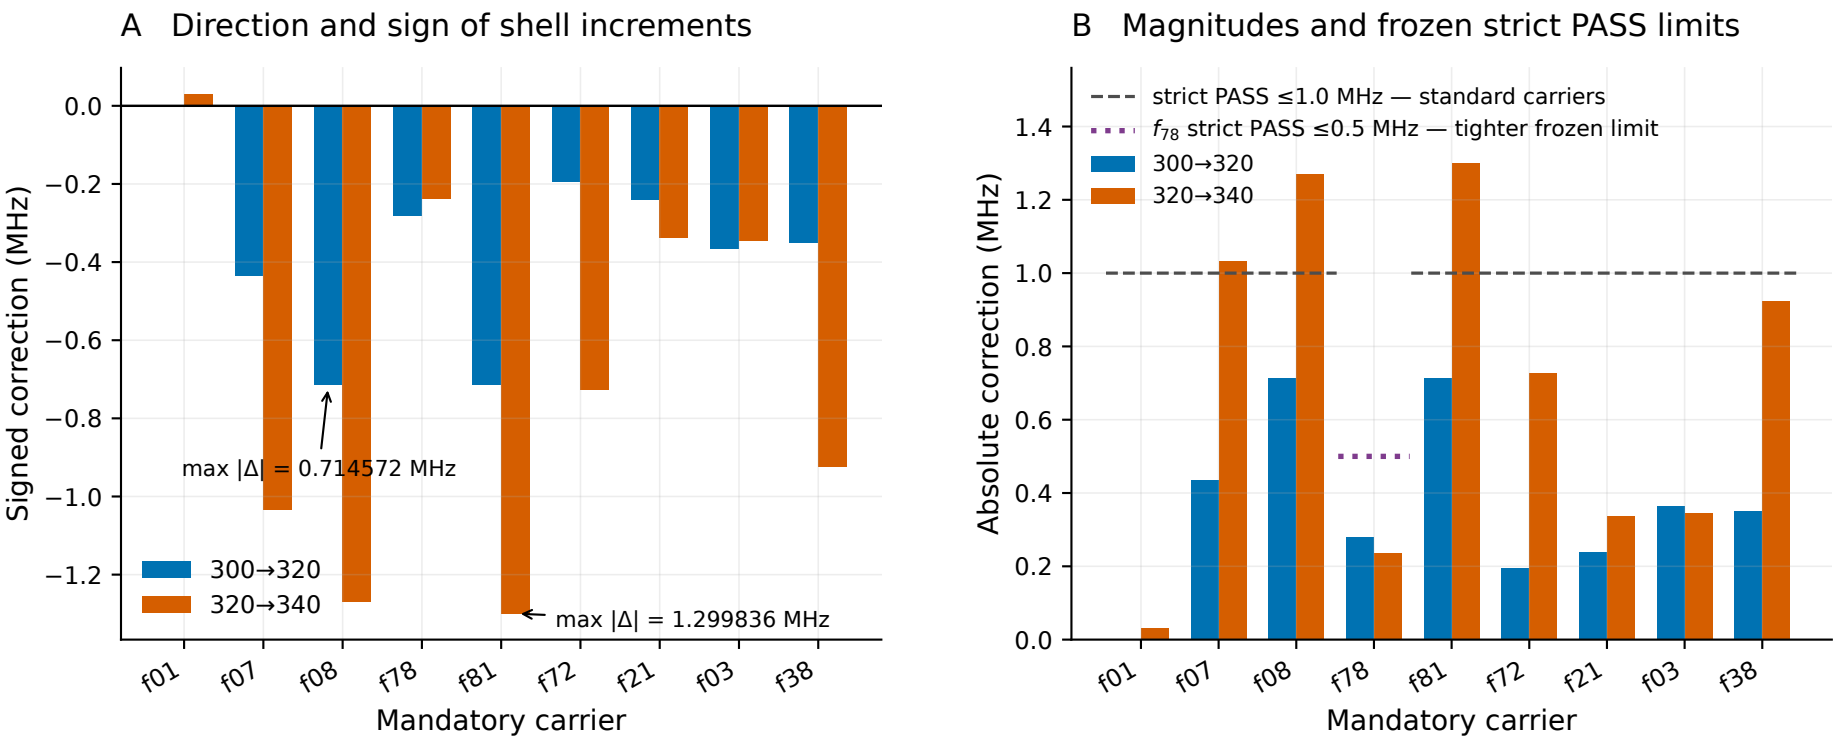
k340 spectral test: the final retained shell does not shrink ($\varepsilon_J = 0.11$)

All practical component comparisons pass; overall retained-basis convergence FAIL.

Failure includes growing final-shell increments, nonmonotonic behavior, and reversal/cancellation criteria.


f_{78} uses the frozen tighter 0.5 MHz strict PASS limit because it is the primary cancellation-sensitive 7↔8 splitting.
Practical PASS limits (not drawn): 5 MHz standard carriers; 1 MHz f_{78}.
